Date 2 Jan 91 From Bob

At a Recent CIAR epidemiology workshop, I was told by Dr. Charles R. Green that RJR plans to conduct a study in the US similar to the one described in the attached manuscript. The study will be done in Columbus OH in "early 1991".

Some questions to consider (some answers are obvious--others are not):

Can such studies be helpful to us, e.g., with OSHA?

Should PM and/or CIAR conduct or sponsor additional studies of this type?

Why doesn't someone do studies of this type in representative Asian (particularly Japanese) and other populations?
